

STOOL TEST

A specific tampon, to be collected at CUP, is needed (the tampon is to be stored at room temperature).

Collect the feces on a clean surface.

Insert the tampon into the feces and then insert it inside the transport medium.

If the sample is to be delivered the day after, please preserve it inside a fridge.

The same tampon can be used even in case the search for Yersinia or the search for Salmonella and/or Campylobacter individually are requie.
