

URINARY CATECHOLAMINES

A specific container and some chloridric acid (which can be both collected at CUP) are needed.

+ chloridric acid

Urinate in the morning around 7 am and discard urines.

Afterwards, collect all the urine produced during the day and the night inside the container, including that produced at 7 am the morning after.

Attention! After the first urination put the chloridric acid inside the container.

During the collection the container is to be stored in a cool place and away from direct light sources.
