

URINE for urethral secretions

A specific sterile container for urine (which can either be collected at CUP or bought in any pharmacy) is needed.

Do not perform intimate hygiene.

Collect the first urine of the morning directly into the container until the urine reaches the height of a thumb, or otherwise wait three hours from the latest urination.

Close the container carefully.

*The same urine can be also used should a *Chlamydia trachomatis*, *Mycoplasma urogenitali* and/or *Trichomonas vaginalis* be needed.*
